

# Make it an **EASYFIX**

## **The revolutionary pro balance wheel centralising kit**

*EASYFIX is the simplest way to fix and centralise spigot mounted wheel assemblies.*

**EASYFIX Scania**

Suitable for a course metric thread

**EASYFIX Universal**

Suitable for a fine metric thread

**EASYFIX Universal Long**

Suitable for a long fine metric thread

Whether you are using a powder balance or lead weights, if the wheel has not been centralised, you will have an imbalance that will result with the driver experiencing vibration, and a potential for uneven tyre wear.

Using EASYFIX will ensure the wheel assembly is centralised and therefore other causes of vibration can be identified.

Examples of these issues can be:

- › Drum distortion
- › Dirt between contact surfaces
- › Wheel bearing failure
- › Incorrect torque setting
- › Incorrect wheel nut torque sequence
